

SOVEREIGN AI WORKFORCE

MP4 Production Guide — From Assets to Rendered Video

A step-by-step path from the existing UI assets to a finished, narrated, subtitled MP4

PRODUCTION GUIDE — v1.0

0. Why This Document Exists

Claude cannot encode video, synthesize speech audio, or drive a live browser to capture screen recordings in this environment — no ffmpeg, no text-to-speech engine, and no video timeline tool are available here. What Claude already produced for this project — the React UI, the mobile app mockups, the landing page, the full demo script with exact timecodes — is the complete creative source material. What's missing is purely mechanical: recording it, narrating it, and compositing it. This guide closes that gap with two concrete paths, both achievable without video editing experience.

15 min	\$0	~30 min	6
Path 1 setup time	Path 1 cost	Path 2 turnaround	Required screens, both paths

1. Path 1 — Self-Recorded + AI Voice-Over

Record your own screen using the existing demo script's exact timings, then generate professional narration with a free AI voice tool, and assemble both with a free editor. This path gives you full creative control and costs nothing.

Step 1 — Open the Real Application

Use the deployed app from the saw-deploy.zip package, or run it locally:

```
cd saw-deploy
npm install
npm run dev
# opens at http://localhost:5173
```

Step 2 — Record Screen Capture (Free Tools)

Tool	Where	Best For
Loom	loom.com — free tier, 1080p, built-in trim, instant share link	Fastest setup, good for a first pass
OBS Studio	obsproject.com — free, open-source, full control, 1080p/4K	Best quality, recommended for the final take
QuickTime (Mac)	Pre-installed — File → New Screen Recording	Zero install, good enough quality

Step 3 — Follow the Existing Shot List Exactly

The full storyboard (13 numbered shots, SB-01 through SB-13) and the precise click-by-click Screen Actions are already written in sovereign-ai-workforce-demo-video-package.docx, Sections 5 and 6. Follow them in order:

Required Screen	Storyboard Ref	What To Do
Dashboard	SB-02	Land on the view, let KPI counters animate fully before any cut
Live Workflow	SB-05 / SB-06	Select scenario, click Run, do NOT touch mouse until all 6 agents show 'done'
Memory	SB-07	Type the search query naturally (2-3 seconds), click Retrieve, pause on match scores
Approval Gate	SB-08	Hover 1s before clicking Approve, hold the executed banner 2s after

Workforce Builder	SB-10	Click Hire on the Project Manager card, let the provisioning log finish
Business Intel + System Status	SB-11	Generate Insights, then cut to System Status — show 'Live' list only

Record each shot 2–3 times. Use the cleanest take — the streaming agent text must be real and unedited, but you control which recorded run looks best.

Step 4 — Generate Professional Voice-Over (Free / Low-Cost)

The full word-for-word script — already written and timed — is in sovereign-ai-workforce-demo-video-package.docx, Section 4. Paste each timestamped block into one of these:

Tool	Where	Free Tier	Notes
ElevenLabs	elevenlabs.io	Free tier: 10,000 characters/month	Most natural-sounding, best for startup-launch quality
Google Cloud TTS	cloud.google.com/text-to-speech	Free tier: 1M characters/month (WaveNet)	High quality, generous free quota
Microsoft Azure Speech	azure.microsoft.com/speech	Free tier: 500,000 characters/month	Very natural neural voices
Murf.ai	murf.ai	Free trial, then paid	Built-in pacing/emphasis controls for VO specifically

Recommended voice profile: a calm, confident male or female voice, 'professional narrator' or 'corporate explainer' preset — avoid 'cheerful' or 'casual' presets, which undercut the enterprise positioning.

Step 5 — Edit Everything Together (Free Tools)

Tool	Where	Best For
CapCut	capcut.com — free, desktop + mobile, built-in auto-subtitles	Fastest end-to-end, recommended for first-time editors
DaVinci Resolve	blackmagicdesign.com — free, professional-grade	Best quality if you have editing experience
Canva Video	canva.com — free tier, simple timeline	Good for adding the intro/outro slides + music

Step 6 — Add Subtitles (English)

- CapCut and Canva both auto-generate subtitles from the audio track — generate, then proofread for accuracy (AI subtitle generation occasionally mishears proper nouns like 'Northwind' or 'pgvector')
- Alternative: use the exact VO script text from Section 4 of the demo video package as the subtitle source — copy-paste avoids transcription errors entirely
- Style: white text, dark semi-transparent background bar, bottom-third placement, max 2 lines per subtitle card

Step 7 — Add Background Music

Source	Where
YouTube Audio Library	youtube.com/audiolibrary — free, no attribution required for many tracks
Pixabay Music	pixabay.com/music — free, royalty-free, downloadable
Epidemic Sound	epidemicsound.com — paid subscription, highest quality if budget allows

Search terms: "corporate tech ambient," "minimal electronic build," or "inspiring startup" — instrumental only, no vocals (competes with narration). Set music volume to roughly 15-20% under the voice-over throughout, ducking further during VO-heavy segments.

Step 8 — Export Settings

Setting	Value
Resolution	1920×1080 (1080p) minimum
Frame rate	30fps
Format	MP4 (H.264 codec)
Audio	AAC, 192kbps minimum
Target length	4–5 minutes (use the Investor Cut timing table, demo package Section 3)

2. Path 2 — AI Video Generation Tools

If you'd rather not manually record and edit, several AI tools can take your existing script, screenshots, and brand assets and assemble a video automatically — with built-in narration and subtitles. This path trades some creative control for speed.

Recommended Tools, Ranked for This Use Case

Tool	Use Case	Why
Pictory.ai	Best for	Turning a long-form script (use the VO script directly) into a scene-by-scene video with auto voice-over and subtitles
Synthesia	Best for	Adding a presenter avatar to deliver the script — useful for the talking-head intro/outro described in the demo package Section 7
Veed.io	Best for	Uploading your own screen recordings (from Path 1, Step 2) and letting AI auto-edit, subtitle, and add music in one pass
InVideo AI	Best for	Generating a first full draft from a text prompt + your brand colors, then manually swapping in your real screenshots

Fastest Concrete Workflow (Veed.io Path)

1. Record your 6 required screens using Loom or OBS (Path 1, Steps 1-3 — this part cannot be skipped, since the AI tools don't have access to your live application)
2. Upload the raw screen recordings to veed.io
3. Paste the VO script (demo package, Section 4) into Veed's "Text to Speech" panel — select a professional/corporate voice preset
4. Use Veed's "Auto Subtitle" feature, then proofread against the original script text
5. Add a track from Veed's built-in royalty-free music library, instrumental/corporate category
6. Use Veed's transition library for cuts between sections — stick to simple cuts and one push-in style, per the Camera Directions in demo package Section 7
7. Export at 1080p/30fps MP4

If You Want an Avatar Presenter (Synthesia Path)

For the optional talking-head intro/outro described in the demo video package (Section 7: "I'm Fateh — and this is the AI workforce I built from Algeria"), Synthesia can generate a presenter avatar speaking your script without filming yourself:

- Paste just the intro and outro lines (8 seconds each) from the VO script into Synthesia

- Choose a professional avatar and a dark/branded background matching the Sovereign AI Workforce navy + amber palette
- Export those two short clips separately, then splice them as the bookends in your main edit (CapCut/Veed) around the screen-recording content

3. Asset Inventory — What You Already Have

Every visual and verbal asset this video needs has already been produced in this project. Nothing below requires new design work — only recording, narration, and assembly.

Asset	Use In The Video
sovereign-ai-workforce.jsx	The real, working application — Dashboard, Live Workflow, Memory, Workforce Builder, Business Intel, System Status
saw-deploy.zip	Deployable Vercel project — run locally or deploy to get a live URL to record from
sovereign-ai-workforce-demo-video-package.docx	Full script: strategy, 2 cuts, complete VO text, 13-shot storyboard, click-by-click screen actions, camera directions, VFX notes, intro/outro slide specs, WOW moments
sovereign-ai-workforce-design-system.docx	Exact colors, fonts, and component specs — keep any added titles/lower-thirds visually consistent with this
landing-page.html	Can be screen-recorded as supplementary B-roll for the cold-open or closing CTA card
mobile-app.html	10 mobile screens — optional cutaway material to show the Approval Center's mobile experience

4. Quick-Start Checklist

The minimum sequence to go from zero to a finished MP4 today:

8. Open saw-deploy locally or use the live Vercel URL
 9. Record the 6 required screens using OBS or Loom, following demo package Section 6 (Screen Actions) exactly
 10. Generate voice-over audio at ElevenLabs or Google Cloud TTS using the exact script in demo package Section 4
 11. Import screen recordings + VO audio into CapCut (or Veed.io for an all-in-one AI-assisted pass)
 12. Auto-generate subtitles, proofread against the script
 13. Add an instrumental corporate/tech track from YouTube Audio Library or Pixabay, ducked under the VO
 14. Insert the Intro Slide and Outro Slide exactly as specified in demo package Sections 9–10
 15. Export: 1080p, 30fps, MP4, 4-5 minutes total
